

JomCode Coding Bootcamp

Git and GitHub workflow

Follow the visible steps and verify each result.

GitHub account and first repository

- 01 Create an individual account at github.com/signup; verify email and enable two-factor authentication.
- 02 GitHub > New repository > name `jomcode-git-practice` > Public. For this local-first route, leave README and `.gitignore` unchecked.
- 03 Make a local practice folder and README.md. Open that folder in VS Code.

First push — run from the practice folder

TERMINAL >_ PowerShell / zsh

```
> git init
> git add .
> git commit -m "First note"
> git branch -M main
> git remote add origin YOUR_HTTPS_REPOSITORY_URL
> git push -u origin main
```

Copy the HTTPS URL from YOUR empty GitHub repo. Complete the browser sign-in prompt.

Verify before continuing

- 01 Refresh GitHub: README.md and the first commit must be visible.
- 02 If identity is missing, set ``git config --global user.name`` and ``user.email`` to your own details, then retry the commit.
- 03 If push fails, check the remote URL with ``git remote -v``; never paste a token into a slide.

Everyday update

TERMINAL >_ PowerShell / zsh

```
> git status
> git diff
> git add .
> git diff --staged
> git commit -m "Update note"
> git push
```

Add only changes you reviewed. One small meaningful commit is easier to understand.

Feature branch — one safe change

TERMINAL >_ PowerShell / zsh

```
> git switch -c feature/add-goal  
# edit README.md and verify it  
> git add .  
> git commit -m "Add goal"  
> git push -u origin feature/add-goal
```

On GitHub: Compare & pull request → Files changed → Merge. Then pull main locally.

After merging

TERMINAL >_ PowerShell / zsh

```
> git switch main
> git pull --ff-only
> git branch -d feature/add-goal
> git status
```

Expected: on main, up to date, working tree clean.

Checkpoint

PROVE IT

Practice repository has two main commits and one merged feature pull request. No exercise.
